Guide

H.O.D.

ACKNOWLEDGMENT

We take this opportunity to express our gratitude to “Karmaveer Bhaurao Patil College of Engineering, Satara” and the Computer Science & Engineering Department for sanctioning us the project topic “Agriculture Marketplace” & for allowing access to various Facilities.

We sincerely wish to express hearty thanks to our Project Guide Prof, Abhijeet Tadsare for his / her encouraging & inspiring guidance. His/her valuable suggestions were a constant source of inspiration for us.

We wish to express our thanks to our Head of Department Prof. Ganesh D. Dangat for encouragement & providing us with the best facilities for our project work. We would also like to thank the other teaching & non-teaching staff.

Last but not the least we would like to thank all our friends, who helped us directly or indirectly. Helpful hand rendered by all of them will remain for a long time in our memory. Finally we admit that cooperation, coordination & hard work are our keywords for success.

Thanking,

1) Gadhae Sanskar Bhanudas

2) Kale Prajwal Balaso

3) Gaikwad Pranav Pratap

4) Gaikwad Abhimanyu Ravaji

1.INTRODUCTION

In any large community, the loss of personal belongings is a common issue, and college campuses are no exception. Students, faculty, and staff frequently misplace items such as smartphones, chargers, wallets, and other personal belongings. The current process of recovering lost items in most colleges is often inefficient and time-consuming, relying on physical lost and found desks or bulletin boards. These traditional methods are not only cumbersome but also lack a centralized system for tracking lost items, leading to confusion and delays in recovery. Additionally, the absence of a streamlined communication channel between the finder and the owner often results in unclaimed items being left in storage or, in the worst-case scenario, never being returned to their rightful owners.

Technological advancements have continually eased human endeavors, allowing us to focus on more complex tasks. In line with this, we have created "LostAndFound" a comprehensive web-based platform specifically designed for college campuses. This application, meticulously built using Python and MySQL, significantly aids users in locating misplaced items with greater efficiency. By submitting detailed information about a lost item, users can quickly initiate a search through the website, streamlining the process of reconnecting with their belongings. The development process employed a versatile combination of technologies, including HTML, CSS, JavaScript, jQuery, Python, Django, and MySQL. Django was deliberately selected for its rapid development cycle, robust security features, and exceptional scalability, making it an ideal framework for this project. Additionally, this platform fosters a sense of community within the college environment, encouraging users to assist one another in recovering lost items. It proves especially valuable in academic settings where essential items like books, keys, wallets, and other personal belongings are frequently misplaced.

To address these challenges, we have developed LostAndFound.com," a web-based platform designed to automate and streamline the entire process of reporting and retrieving lost items. Our platform offers a centralized digital solution that enables users to quickly and easily report lost or found items, upload descriptions and images, and communicate with other users in real time. By integrating an intuitive user interface with robust backend functionality, LostAndFound.com not only improves the efficiency of the lost and found process but also enhances the overall experience for users by providing a seamless and transparent method for recovering their belongings.

2.EXISTING SYSTEM STUDY

When studying the existing system of a Campus Lost and Found, we analyze how the current process functions without a dedicated digital system or with minimal digital involvement. Here's a structured overview

- **Reporting Lost Items**
Students or staff report lost items to the administrative office or security desk.
The complaint is usually written in a register or logbook.
Limited details are captured (e.g., item name, date, person's name)
- **Reporting Found Items**
If someone finds an item, they hand it over to security or admin.
Details are noted manually in the same or separate register.
- **Item Storage**
Found items are stored in a lost and found room or box, usually at the security office.
Items are organized by date or type but not digitized.
- **Matching & Claiming**
To claim, the owner must give a physical description or proof.
Matching relies on manual checking of the register.
- **Storage**
Items are placed in a Lost and Found box, drawer, or shelf.
No digital categorization or real-time tracking exists.
- **d. Claiming the Item**
The owner must describe the item and show ID proof.
Staff manually check records to verify a match.
If matched, the item is handed over and the entry is updated.

3.OBJECTIVES

Project objectives:

- 1. To provide an easy-to-use web interface for reporting lost and found items.
- 2. To store item information digitally in a centralized database for quick retrieval.
- 3. To reduce manual paperwork and the time spent tracking items.
- 4. To notify users when a similar item is found or claimed.
- 5. To improve accountability and transparency in the item recovery process.
- 6. To ensure proper record-keeping and minimize disputes or misclaims.
- 7. To enhance campus communication by keeping students and staff informed.

Academic Objectives:

1. To learn and apply web development techniques, focusing on creating a seamless user experience using HTML and CSS.
2. To design and implement a lost and found system using MySQL for lost and found information, and real estate information efficiently.
3. To gain practical experience with PHP for server-side development and MySQL for database management.

4.PROPOSED SYSTEM

The Campus Lost and Found process system is designed to help students, faculty, and staff easily report, locate, and claim lost or found items within the campus premises. The process begins when a user submits details of a lost or found item through a digital form on the website or application. The form collects key information such as the item type, description, name of the person reporting, and the location where it was lost or found. This data is then stored in a centralized database. Users looking for lost items can browse or search the database to check if their item has been found. Once an item is identified, the rightful owner can request to claim it by providing sufficient proof or matching details. Admin staff may then verify the information before handing over the item. This system replaces the traditional manual entry in registers, reduces errors, and enhances transparency by ensuring that all items are tracked properly, with automatic updates and notifications. Overall, it makes the lost and found process faster, organized, and more efficient across the campus.

SYSTEM ARCHITECTURE :

Fig .System Architecture

MODULES

1. Report an item

1. User Input Form:

Enables the user to submit details of lost or found items.

Collects information like item name, category, description, date, and location.

2. Image Upload Feature:

Allows attaching a photo of the item for better identification.

3. Database Storage:

Saves the submitted item details and images securely in the database.

The screenshot shows a web application interface for reporting lost or found items. At the top, there is a purple header with the title "Report an Item". Below the header is a navigation bar with three links: "Home", "View Lost Items", and "View Found Items". The main content area is light blue and contains a white form. The form has two radio buttons at the top: "Lost" (selected) and "Found". Below the radio buttons are four text input fields: "Item Name:" with the value "Bag", "Description:" (empty), "Location:" with the value "washroom", and "Contact Details:" with the value "8421145156". At the bottom of the form is a blue "Submit" button.

2. Found Items

1. Found Item Registration:

Enables a user or staff member to register an item found on campus.

2. Detailed Item Information:

Collects details like item name, category, description, date found, and location.

3. Image Upload:

Allows attaching a photo of the found item for easy identification.

3. Lost Items

Lost Item Registration:

Enables users to register items they have lost on the campus.

2. Detailed Item Information:

Collects details such as item name, category, description, date lost, and location.

3. Image Upload Feature:

Allows attaching a photo of the lost item for better identification.

5.REQUIREMENT ANALYSIS:

Software Requirements:

- Visual Studio Code
- MYSQL
- HTML
- CSS
- JS
- PHP
- WebBrowser(Crome,Microsoft Edge)

Hardware requirements:

- ClientDevices :
Smartphones,PCs used by farmers and buyers
- Network Infrastructure:
Reliable internet connectivity for users

6.PROJECT SCHEDULING

1. Planning Phase

- Identify the problem with existing manual lost and found system.
- Gather requirements from students, staff, and admin.
- Define system goals (reporting, searching, claiming items).

2. Requirement Analysis

- Decide what features the system needs:
- Item submission form
- Search functionality
- Admin dashboard
- Notification system
- Identify software tools and technologies to use (HTML, CSS, JS, Node.js, database).

3. Design Phase

- Create wireframes or UI mockups for user and admin interfaces.
- Design the database schema (e.g., item type, description, date, status).
- Decide on frontend-backend communication flow.

4. Development Phase

- Frontend development (HTML/CSS/JavaScript forms and pages).
- Backend development (API endpoints to store and retrieve data).
- Connect frontend to backend using fetch/axios.
- Store data in a database (like MongoDB or MySQL).

5. Testing Phase

- Unit testing of each module (form submission, item listing).
- Integration testing (check data flow between frontend and backend).
- User testing with sample lost/found reports.

6. Deployment Phase

- Host the system on a server or local network.
- Ensure the system is accessible to students and staff on campus.

7.ADVANTAGES AND LIMITATIONS OF THE PROPOSED SYSTEM

ADVANTAGES OF CAMPUS LOST AND FOUND SYSTEM

1. Easy Recovery of Items: Enables quick posting and searching of lost or found items within the campus.
2. Time-Saving: Reduces time and effort for both students and staff to locate lost belongings.
3. Centralized Platform: Provides a single, organized space for all lost and found listings.
4. Better Communication: Enables direct interaction between item owners and finders.
5. Increased Transparency: Builds trust by making the recovery process more open and trackable.
6. Environment Friendly: Reduces paper notices and manual record-keeping.
7. Improved User Experience: Simple and convenient for students and staff to use from any device.

LIMITATIONS OF CAMPUS LOST AND FOUND SYSTEM

- 1.Limited Awareness: Its effectiveness depends on widespread use and awareness within the campus.
2. Internet Dependence: Requires internet connectivity, which can be an issue in certain areas.
3. Authentication Challenges: Needs strong verification to prevent misuse or fraudulent claims.
4. Data Maintenance: Requires regular updating and monitoring of lost and found listings.
5. Privacy Concerns: Must secure sensitive user information (names, contact details) effectively.
6. Limited Scope: Works best within the campus environment and may not help with items lost elsewhere.

8.Future Scope

1.Mobile App Development:

Create a mobile version of the platform for easy access and instant notifications.

2. Location Tracking:

Integrate GPS or campus map features to tag found items with precise locations.

3. Image Recognition:

Use AI and image processing for automatic item identification and matching.

4. Real-Time Chat:

Enable in-app chat between finders and owners for quick and secure communication.

5. Barcode/RFID Integration:

Use barcode or RFID tagging for valuable campus assets and seamless recovery.

6. Push Notifications:

Send alerts for lost item matches, status updates, and claim approvals.

7. Expanded Reach:

Cover nearby areas (hostels, adjacent buildings) and integrate with other institutions.

8. Automated Reports and Insights:

Provide analytics for administrators to understand common lost item trends and hotspots.

9. Additional Language Support:

Make the platform multilingual for wider accessibility across diverse student populations.

9.CONCLUSION

The Campus Lost and Found website is an effective and innovative solution that bridges the gap between those who have lost their belongings and those who have found them within the campus. By providing a centralized, digital platform, it eliminates the inconvenience of traditional paper-based notices and allows seamless access for students, staff, and faculty. Its user-friendly design and robust features, such as item listing, searching, and claim processing, make it a valuable tool for streamlining lost and found procedures.

Moreover, this website promotes accountability and trust within the campus community. By ensuring that every lost or found item is properly logged and verified, it reduces the risk of mismanagement and encourages prompt recovery of belongings. The platform benefits not only individual users but also campus administrators by providing a structured and transparent system for managing lost and found items.

Looking ahead, the future scope of the website is promising. Incorporation of mobile app access, GPS-based item tracking, automated alerts, and image recognition can further improve its efficiency and user experience. As a result, the Campus Lost and Found website can evolve into an indispensable service that strengthens connections within the campus, saves valuable time, and sets an example for other institutions to adopt similar digital solutions.
